# 1 Phase 1 Project 1- Microsoft Movie Industry Analysis

# 1.1 Author: Jhonathan D. Herrera-Shaikh

### 1.2 Overview

# 1.2.1 Business Understanding & Business Problem

Microsoft, an American multinational technology company that produces computer software, consumer electronics, personal computers, and related services headquartered at the Microsoft Redmond campus located in Redmond, Washington, United States, wishes to enter the movie industry as a strategic company objective given the high returns of companies in this industry.

The problem for Microsoft is that they do not know how to analyze vast amount of data residing in a collection of databases available to gain insight into the market. They wish to collect, prepare, and extract valuable business insights from these databases that will help them make great tactical initial decisions. Decisions for example, as to what type of movies should they initially support and why. And, if once supported, when would it be a good time to promote and publish these films. Given the vast amount of data available in databases about movies, they really need help from a data scientist firm that can help them overcome their challenge, and realize the beggining steps of their strategic objective.

Fortunately for Microsoft, the best data scientists consulting companies in the world have started to form. One of them, and probably the most reliable,is Pandas Soldiers Data Science Inc. run by one man, CEO Jhonathan David Herrera-Shaikh, a leader in this field. Microsoft turns to him for help them acquire information so that they can intelligently invest their dollars with the highest chance of being successful

Here in this presentation, therefore I will gain access to available databasases and the moviesinformation in it. I have to find information that would be relevant for Microsoft executives to enter the market. I'll first find descriptive information about movies in the movie industry. Second, I will decide which data factors are the most relevant and can have the most value for decision making. Third, I'll make an analysis on the data and provide insight and analytical findings while finally I will recommend the 3 best course of actions recommendations for the business exectives in the initial stages of their strategic objective.

# 1.3 Data Story

In this presentation I explored all 11 databases provided, however utilized 5 databases for my recommendation including:

- studio\_gross: Industry competitors data about studios, the competitors of Microsoft. Identifying the names of the studio and their gross revenues both domestically and internationally.
- 2. bon.movie\_gross.csv: Movie data. Identifying how much revenues has movie titles brought and in what year.
- 3. tn.movie\_budgets.csv: Movie data. Identifying the budget for each production and how much money did each movie made as well as each movie's realese date.
- 4. opus.data: Free and available database available to the public for free with information about movies including their genres and revenue
- 5. imdb.title.basic.csv: Movie data. Identifying runtimes of movies, movie's titles and genres.

# 1.4 Recommendations

My analysis of the movie industry, achieved by munching data and utilizing visualizations on the databases for analysis, showed three main business relevant insights for business decision making and are as follows:

- 1. Microsoft should focus on understanding their competition, the top 5 market share holders their revenue streams preparing business strategies for both the domestic and foreign markets as the top market share holders recognize revenue from both streams.
- 2. Microsoft is first focus on 3 main genres initially, Drama, Action, Adventure and Comedy (possibly Thrillers as fourth one). This because there is more information and most sales for genre type, and we should start production knowing where to focus. Now that we know this, since Microsoft knows now begin, the next step is discovering more about them. I also recommend to approach getting to know these genres further, extracting databases specifically for these genre types to extract detailed value as to what factors influence these genres.¶
- 3. Microsoft is first focus Adventure and Action productions, and consider Musicals. This because the worldwide gross in these genre types provide the highest opportunity of worldwide gross earnings. Now that we know this, since Microsoft wants to be profitable and drive up revenues, we now now where that is likely to occur. I also recommend to approach getting to know these genres further, extracting databases specifically for these genre types to extract detailed value as to what factors influence these genres.

# 1.5 Methodology

The methodology to arrive at a recommendation on each database analyzed consisted of three steps. I did my set up for EDA (Exploratory Data Analysis) successfully, first loading, understanding, and cleaning the databases. To accomplish this, I imported the necessary libraries from Python, reading and exploring the data in the the databases through Pandas, and identifying modification and cleaning opportunities as necessary, finally visualizing and making a recommendation. In summary:

#### Step 1: Data Load & Transform to Pandas

#### Step 2: Data Understanding & Cleaning

#### Step 3: Data Visualization, Analysis, Recommendation

# 1.6 Future Work:

In addition to these initial recommendations. There is still additional insight that can be drawn from Microsoft databases. This includes, for example, impact of run times per movies genre or type in relationship to world gross.

# 2 Data Load & Transformation

# 2.0.0.1 Importing Libraries

```
In [233]: import pandas as pd
   import numpy as np
   import matplotlib.pyplot as plt
   import seaborn as sns
   from bs4 import BeautifulSoup
   import requests

%matplotlib inline
```

#### 2.0.0.2 Loading Databases & Transforming into Pandas

```
In [234]: #transforming the CSV files
          df studio
                             = pd.read_csv ('data/studio_gross.csv',
                                                                            float prec
                             = pd.read csv ('data/bom.movie gross.csv',
          df bommoviegross
                                                                            float prec
          df rating
                             = pd.read csv('data/imdb.title.ratings.csv',
                                                                            float prec
          df basics
                             = pd.read csv('data/imdb.name.basics.csv')
          df titles
                             = pd.read csv('data/imdb.title.akas.csv')
                             = pd.read csv('data/imdb.title.basics.csv')
          df titlebasics
          df crew
                             = pd.read csv('data/imdb.title.crew.csv')
                             = pd.read csv('data/tn.movie budgets.csv')
          df budget
                             = pd.read csv('data/imdb.title.principals.csv')
          df principals
          imdb
                              = pd.read csv('Data/imdb.title.crew.csv')
          #transforming the TSV file
          df tsvmovie
                             = pd.read csv('data/rt.movie info.tsv', delimiter='\t')
```

2.0.0.3 First taking a look at the head and tail, shape and information. With the goal to understand the data and conduct EDL (Exploratory Data Analysis)

In [155]: # Observing and exploring database 1

```

Microsoft would want to know the market first. Based on this premise, I'd recommend Microsoft first to understand who their biggest competitors are. We have discovered who they are and their revenue by stream (foreign or domestic). Knowing this will set up other analysis that are more tailored towards understanding these top competitors. Microsoft can't underestimate the foreign markets. This is because the top players play in both, domestic can foreign. We understand how big of the market share do they really hold.

# 3.1 Recommendation 1

My first recommendation to Microsoft is to research that BV, Fox, WB, Uni, and Sony, because they have a hold on the the largest share of the market, and we should mimic their production methodology (how they operate, who are their leaders, what movie(s)/genres makes them the most money). Since Microsoft wants to be in the big leagues, I also recommend to approach the research knowing focusing on understanding the business strategy in both foreign and the domestic market strategy, as these top players clearly earn revenue from both streams.

# 4 2nd Data Analysis Process: Uses 2 DB's- Join for analysis

# 4.0.1 database: df\_budget. Containing information about movies, production budgets, domestic and worlwide gross.

1932 rows × 7 columns

# 4.1.1 Now that I have a Joined Database (df\_super) I'll visualize and analyse to propose recommendations

# 4.1.1.1 Plotting my chart

```
In [232]: # plotting the number of movies per genre in dataset to find out insight an
   plt.figure(figsize=(12,8))
    sns.countplot(x='genre', data=df_super, palette='colorblind')
   plt.title('Amount of Movies per Genre', fontsize=18)
   plt.ylabel('Count', fontsize=20)
   plt.xlabel('Genre', fontsize=20)
   plt.xticks(fontsize=20)
   plt.yticks(fontsize=20)
   plt.yticks(rotation=-80);
```

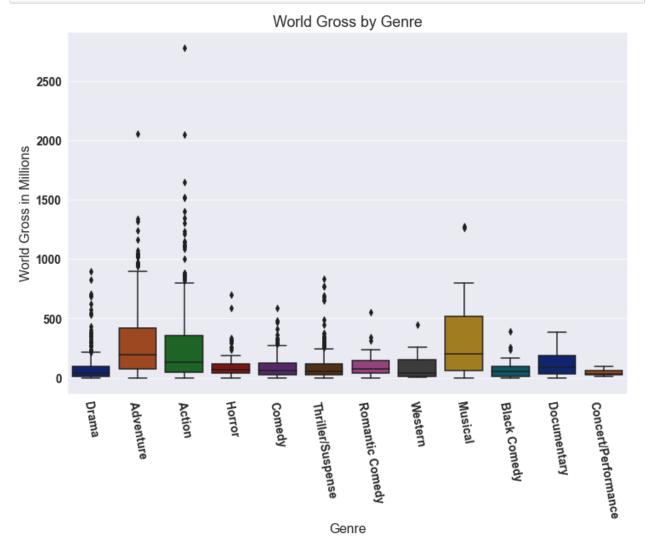

# 4.2 Analysis

4.2.0.1 Microsoft would want to know what movies sell the most. Based on this premise, we have discovered what genres are the most popular out of 1,932 movie titles and each title being identified by genre type we can realize valuable information. Knowing these main genres will provide guidance as to the next step, to set up tailored analysis on these genres that will tell us how to make these type of movies succesfully. Microsoft can't start making Romantic Comedy, Documentaries as these are clearly the least estimated by the public.

# 4.3 Recommendiation 2

4.3.0.1 My second recommendation to Microsoft is first focus on 3 main genres initially, Drama, Action, Adventure and Comedy (possibly Thrillers as fourth one). This because there is more information and most sales for genre type, and we should start production knowing where to focus. Now that we know this, since Microsoft knows now begin, the next step is discovering more about them. I also recommend to approach getting to know these genres further, extracting databases specifically for these genre types to extract detailed value as to what factors influence these genres.

```
In [109]: #For my visualizations, I found it helpful to show my plots both with and w
# generating box plot of world gross statistics per genre
plt.figure(figsize=(12,8))
sns.set_style('darkgrid')
sns.boxplot(x='genre', y='worldwide_gross', data=df_super, palette='dark')
plt.xticks(rotation=-80)
plt.ylabel('World Gross in Millions', fontsize=16)
plt.xlabel('Genre', fontsize = 16)
plt.title('World Gross by Genre', fontsize = 18)
plt.xticks(fontsize=14)
plt.yticks(fontsize=14);
#saved in images as fig2
#plt.subplots_adjust(bottom=0.2)
#plt.savefig('./images/fig2.png')
```

# 4.4 Analysis

4.4.0.1 Microsoft would also want to know about money. Worldwide gross earnings is a very good factor in knowing this. Through this anlysis, the chart above makes us visualize the reality for worwide gross and tells us the about opportunity that there is in making world gross in million by genre. With this information we can understand what types of movies generate the highest gross worlwide and can make a recommendation as well as noting

interest findings. For example, in our previous graph we saw the genre type musical as low in count of movies, we see that it has a high potential to make worlwide gross.

#### 4.4.1 Recommendation 3

4.4.1.1 My third recommendation to Microsoft is first focus Adventure and Action productions, and consider Musicals. This because the worldwide gross in these genre types provide the highest opportunity of worldwide gross earnings. Now that we know this, since Microsoft wants to be profitable and drive up revenues, we now now where that is likely to occur. I also recommend to approach getting to know these genres further, extracting databases specifically for these genre types to extract detailed value as to what factors influence these genres.

# **5 Summary & Conclusions**

- 5.1 My analysis of the movie industry, achieved by munching data and utilizing visualizations on the databases for analysis, showed three main business relevant insights for business decision making and are as follows:
  - 1. Microsoft should focus on understanding their competition, the top 5 market share holders their revenue streams preparing business strategies for both the domestic and foreign markets as the top market share holders recognize revenue from both streams.
  - 2. Microsoft is first focus on 3 main genres initially, Drama, Action, Adventure and Comedy (possibly Thrillers as fourth one). This because there is more information and most sales for genre type, and we should start production knowing where to focus. Now that we know this, since Microsoft knows now begin, the next step is discovering more about them. I also recommend to approach getting to know these genres further, extracting databases specifically for these genre types to extract detailed value as to what factors influence these genres.¶
  - 3. Microsoft is first focus Adventure and Action productions, and consider Musicals. This because the worldwide gross in these genre types provide the highest opportunity of worldwide gross earnings. Now that we know this, since Microsoft wants to be profitable and drive up revenues, we now now where that is likely to occur. I also recommend to approach getting to know these genres further, extracting databases specifically for these genre types to extract detailed value as to what factors influence these genres.
- 5.1.0.1 This was a great practice project. It made me practice what I've learned in Phase 1. It forced me to think as a real world data scientist. Moreover, it made me see my strenghts but also my weaknesses in areas I need to improve moving forward. I was able to make recommendations with my new knowledge to Microsoft and I'm very happy about that.
